Preface	vii
About the authors	ix
Abbreviations	xi
1 Introduction: why study polymers for the health sciences?	1
1.1 Polymers are large molecules that nature relies on	2
1.2 A brief history of polymers	4
1.3 Definitions	5
1.4 Morphology and nomenclature of polymers	6
Bibliography	16
2 General characteristics of polymers	19
2.1 Characterisation of polymers	20
2.2 Specific properties of polymers in the presence of liquid media	35
2.3 Relationships between structure of polymers and cohesion of materials	44
2.4 Properties of polymers as materials	48
Bibliography	53
3 Main methods and processes to synthesise polymers	55
3.1 Why there is a need to synthesise polymers	55
3.2 Introducing step and chain polymerisation	56
3.3 Some examples of step polymerisation: from small reagents and from prepolymers	58
3.4 Free radical chain polymerisation	59
3.5 Limitations of polymerisation	64
3.6 Overview of other synthetic methods	66
3.7 Polymerisation reaction processes	73
3.8 Copolymerisation	80
3.9 Modifications of polymers	81
Bibliography	85

4	Special properties of polymers, case studies and detailed examples of applications	87
4.1	Properties of block copolymers: phase separation in solution and at solid state	87
4.2	Biodegradable and bioerodible polymers	91
4.3	Applications of polymers in biomedical uses	98
4.4	Applications of polymers in pharmaceutical uses	114
	Bibliography	148
	Glossary	151
	Index	155
