INTRODUCTION TO COMPARING

XV

rand Mathodology Whish Composing Steel Standards

Were comparing start-startingly from different actional and informational standard development proprotions (SDOS) there is no such using at equivalent sized dimilends. At heat, one must be able to compare the start containers increditor based to some defined and of radio, which can be able to compare the start containers increditor based to some defined and of radio, which can be able to compare the basedheads. For example, (STOLA 515 A 5155), (Spede 70 is compared to be 10 1000 some STA 480 and to SN 100025-2 start cannon PENGAL search on chamical convenients of the methods of policies on the start cannon resolution in the start of the start of the containers or spectral to the SN 100025-2 start cannon PENGAL search on chamical convenients of the methods of spectral to the SN 100025-2 start cannon resolutions increased on chamical convenients of the method of the SN 100025-2 start cannon resolution of the start of the start of the containers of spectral to the SN 100025-2 start cannon resolution of the start of the start of the containers of the start of the containers of the start of the containers of the start of the containers of the start of the containers of the start of the containers of the start of

These differences muy be significant, in one user, but not significant to another user. Altereloys, has provident users the term componates: to drame similar mandards that have bong compared to such their. Comparative is brockfive word that to inevitably dependent up to the and there's requirements, when is ultimately responsible for consting the approximate stud for a specific application.

There are non-shoul standards that are disted by multiple SDOs. For example, EN 180 (867 - The family, is a situalized that is showed within the European Connectives for Standardinstice (CEN) and the interactional Standards Organization (ISO) systems. Consequently, the data are equivalent to both systems, but shows is only one standard.

There are also different elements that every the same gradet of stopl. For chample, ASTM A 498 and EE 150 583-17 above serve identical bearing sheet grade elemental compositions, but there are differences in grain size, hardenability, microsferenceive, hereiness, importion, trating, and is other density of noth standards. As a result, there serves hereines sheets within these two standards are spienvironistic, but are variparable.
