

Roman Schwartz, Michael Borys, Frank Scholz

Guide to Mass Determination with High Accuracy

Contents

1.	Introduction and Summary	1
1.1.	Classification of weighing instruments	1
1.2.	Weighing procedure	1
1.3.	Prerequisites for exact mass determinations	2
2.	Measurement Principles and Adjustment of Balances	3
2.1.	Physical principles and actual scale interval of a second scale man	3
2.2.	Mechanical equal-armed beam balance	4
2.3.	Electromechanical balance with built-in weights	4
2.4.	Electronic analytical and comparator balance	6
2.5.	Mass comparators	9
2.6.	Adjustment of electromagnetically compensated balances	13
3.	Substitution Weighing in Air	15
3.1.	Weighing method, weighing cycle	15
3.2.	Weighing equation, air buoyancy correction	16
3.3.	Determination of air density	17
3.4.	Example of the calculation of the air density and its uncertainty	22
4.	Influence Quantities and Disturbance Factors	24
4.1.	Thermal influences	25
4.2.	Air pressure, air humidity, adsorption	28
4.3.	Level of the centre of gravity, gravitational acceleration	30
4.4.	Electrostatic fields	31
4.5.	Magnetic fields	31
4.6.	Mechanical Influences	34
5.	Volume Determination of Mass Standards and Weights	36
5.1.	Hydrostatic weighing	36
5.2.	Density of water	38
5.3.	Influence quantities in hydrostatic weighing	38
6	Uncertainty of Mass Determination	30
61	Terminology	20
6.2	Input quantities and uncertainties in differential weighings	30
6.3	Example for calculating the mass and its uncertainty	30
0.0.	Example for calculating the mass and its uncertainty	33
7.	Realisation of a Mass Scale	39
7.1.	Mathematical description of weighing equations	39
7.2.	Accounting for secondary conditions	39

Introduction and Summary

7.3. 7.4. 7.5.	Least-squares analysis with weighting of the weighing equations Calculation of uncertainties with the variance-covariance matrix Example of a least-squares analysis with weighting	39 39 39
8.	References	39
	Example for calculating the mass and its uncertainty •	
	Accounting for secondary conditions
