Part 1 Fracture and Failure Mechanisms

1 Theoretical and Experimental Evaluation of Mechanical Properties	3
1.1 Introduction	3
1.2 The Basic Mechanics of a Composite System—Simple Analytical Models	4
1.2.1 The netting analysis	4
1.2.2 The law of mixtures (LOM)	7
1.2.3 The effect of matrix phase yielding on elastic modulus	11
1.2.4 The ultimate tensile strength	16
1.3 The Basic Mechanics of a Composite System—Elasticity Models	23
1.3.1 Longitudinal modulus	26
1.3.2 Poisson's ratio	29
1.3.3 Transverse modulus	29
1.3.4 Shear modulus	30
1.4 The Basic Mechanics of a Composite System—Semiempirical Models	31
1.4.1 Halpin-Tsai (H-T) equations	31
1.4.2 The Nielsen's equations	32
1.5 Methods of Composite Testing	33
1.5.1 Single fiber tests	34
1.5.2 Tensile strength and modulus	34
1.5.1.1 The vibration technique	35
1.5.2.2 ASTM standard	35

- 1.5.3 The coefficient of thermal expansion
- 1.5.4 Matrix properties testing
 - 1.5.4.1 Neat resin matrix tests
- 1.5.5 Composite properties
 - 1.5.5.1 Density
 - 1.5.5.2 Fiber volume
 - 1.5.5.3 Voids
 - 1.5.5.4 Thermal expansion
 - 1.5.5.5 Tensile properties
 - 1.5.5.6 Transverse properties
- 1.6 Tables of Mechanical Properties for Various Fiber and Matrix Materials
- References

2 Failure Mechanisms and Failure Criteria

- 2.1 Introduction
- 2.2 Micromechanics of Failure Under Longitudinal Tension
 - 2.2.1 Composites with ultimate tensile strain of the fiber lower than that of the matrix
 - 2.2.1.1 Mechanics of materials approach
 - 2.2.1.2 Stress field around a fiber break
 - 2.2.1.3 Statistical analysis of failure
 - 2.2.1.4 Failure mechanisms around a fiber break
 - 2.2.2 Composites with ultimate tensile strain of the matrix lower than that of the fiber
 - 2.2.2.1 Mechanics of materials approach
 - 2.2.2.2 Matrix cracking
 - 2.2.2.3 Fiber-matrix debonding
 - 2.2.2.4 Stress-strain curve
- 2.3 Micromechanics of Failure under Longitudinal Compression
- 2.4 Micromechanics of Failure under Transverse Tension or Compression
- 2.5 Micromechanics of Failure under In-plane Shear
- 2.6 Macromechanical Failure Criteria
 - 2.6.1 Introduction
 - 2.6.2 Macroscopic strength parameters
 - 2.6.3 Isotropic failure criteria
 - 2.6.4 Anisotropic failure criteria
 - 2.6.5 Maximum stress criterion

2.6.6	Maximum strain criterion	100
2.6.7	Distortional strain energy criterion (Tsai–Hill)	102
2.6.8	Interactive tensor polynomial criterion (Tsai–Wu)	104
	References	104
3	Delamination and Debonding	109
3.1	Delamination	109
3.2	Mechanics of Delamination	114
3.2.1	Strain energy release rate analysis	114
3.3	Effect of Matrix Material on Delamination	117
3.4	Effect of Fiber–Matrix Adhesion	118
3.5	Effect of Reinforcement Volume Fraction	118
3.6	Effect of Fiber Bridging and Crack-tip Splitting	119
3.7	The Effect of Anisotropy and Fiber Orientation	120
3.8	Effect of Loading Rate	121
3.9	Effect of Environmental Conditions	121
3.10	Effect of Time and Temperature	123
3.11	Data-reduction Methods	124
3.12	Delamination in Sandwich Structures	126
3.13	The Variable Correction Factor Model VCFM	128
3.14	Debonding	136
3.15	Micromechanical Test Methods	140
3.15.1	Fragmentation test	140
3.15.2	Pull-out	143
3.15.3	Microbond test	144
	References	145
4	Fracture Toughness and Fatigue Crack Growth	147
4.1	Introduction	149
4.2	Basics of Fracture Mechanics	152
4.3	Mode I Interlaminar Fracture	157
4.3.1	Data-reduction schemes	162
4.3.2	Fiber bridging	166
4.3.3	Mode I fatigue loading	175
4.3.4	Miscellaneous	178
4.4	Mode II Interlaminar Fracture	178
4.4.1	Edge-notched flexure (ENF) test	181
4.4.2	End-loaded split (ELS) test	188
4.5	Mode I Loading of Notched Composites	196

4.6	Acoustic Emission for Characterization of Fracture in Composites	207
	References	222
5	Notch Size Effects	227
5.1	Introduction	227
5.2	Premature Fracture in Tension Caused by a Notch	228
5.2.1	Notch effects	228
5.2.2	Toughness of composites materials	229
5.2.3	Criteria and models	231
5.2.3.1	The point and average-stress criteria: PSC and ASC	231
5.2.3.2	The two-parameter criterion: TPC	232
5.2.3.3	The progressive-degradation model and minimum strength model: PSM and MSM	232
5.3	Effect of a Notch on the Fatigue Strength	239
5.3.1	Fatigue strength in laminates	239
5.3.2	Effect of a notch in woven composites	239
5.3.3	Fatigue in compression	241
	References	245
6	Constant and Variable Amplitude Fatigue Damage of Laminated Fibrous Composites	247
6.1	Introduction	247
6.2	Fatigue Damage Mechanisms in Laminated Composite Materials	249
6.3	Fatigue Design Approaches to Composite Structural Components	254
6.4	Fatigue Damage Functions	259
6.4.1	Fatigue theories based on $S-N$ curves	259
6.4.2	Fatigue models based on residual stiffness and residual strength	260
6.4.3	Tensorial damage functions	262
6.4.4	Fracture mechanics models	264
6.4.5	Fatigue damage assessed from nondestructive evaluation	264
6.5	Fatigue Life Prediction Based on $S-N$ Data	265
6.5.1	Hashin-Rotem fatigue failure theory	266
6.5.2	Fawaz-Ellyin fatigue failure theory	267
6.5.3	Owen and Griffiths fatigue failure theory	268
6.5.4	Failure theory based on a tensorial polynomial theory (FTP)	269

6.6	Fatigue Damage Assessed from Material Degradation and Nondestructive Evaluation Data	271
6.6.1	Definition of the Damage Severity Factor DSF	274
6.6.2	Derivation of fatigue damage functions	278
6.6.3	Relation of the damage parameter DSF' to the laminate residual properties	281
6.7	Damage Functions for Variable Amplitude Fatigue Loading	286
6.7.1	Transformation of an irregular fatigue spectrum into distinguished cycles	287
6.7.2	Fatigue damage accumulation under variable amplitude loading	288
6.7.3	Application	292
6.8	Conclusions	294
	References	295

Part 2 Case Studies: Aerospace, Construction, and Medical Engineering

8 Behavior of Composite Structures under Impact Loading	363
8.1 Introduction	363
8.2 Crashworthiness of Aircraft Structures	365
8.2.1 The crash environment	365
8.2.2 Structural crashworthiness requirements	367
8.3 Tools for the Simulation of Impacted Composite Structures	370
8.3.1 The finite element technique	370
8.3.2 Modeling aspects of composite structures in PAM-CRASH FE code	373
8.4 Case Studies on the Crash Failure Behavior of Novel Composite Aircraft Structures	376
8.4.1 Simulation of the mass drop test of a composite box beam	378
8.4.2 Simulation of a static crush test of a sine-wave beam	381
8.5 Studies on the Impact Behavior of the "Tensor Skin" Concept	385
8.5.1 Crushing behavior of the one-dimensional "tensor skin" strip	387
8.5.2 Simulation of the two-dimensional tensor skin strip static crush test	390
8.5.3 Simulation of the static crush tests of the three-dimensional tensor skin panels	392
8.5.3.1 Results of the simulation of the "Mid0St" static crash test	393
8.5.3.2 Results of the simulation of the "Mid45St" static crash test	396
8.5.4 Simulation of the mass drop tests of the tensor skin panel	398
8.6 Conclusions	405

9.1 Introduction	407
9.2 Materials and Techniques	410

9.2.1	Materials	410
9.2.2	FRP products and methods of application	411
9.2.3	Special techniques	412
9.3	Flexural Strengthening	414
9.3.1	General	414
9.3.2	Materials modeling	415
9.3.3	Failure modes	415
9.3.4	Failure analysis of rc elements strengthened in flexure	418
9.3.4.1	Steel yielding followed by concrete crushing	418
9.3.4.2	Steel yielding followed by FRP fracture	419
9.3.4.3	Concrete crushing	420
9.3.4.4	FRP peeling-off at the outermost crack in the anchorage zone	421
9.3.4.5	FRP plate-end shear failure	425
9.3.4.6	FRP peeling-off at flexural cracks in the constant moment region	427
9.3.4.7	FRP peeling-off caused by shear cracks	427
9.3.4.8	FRP peeling-off caused by unevenness of the concrete surface	427
9.3.4.9	Bond failure in the adhesive	428
9.3.4.10	Bond failure in the interfaces between FRP, adhesive and concrete	428
9.3.4.11	Shear failure in the FRP (interlaminar shear)	428
9.3.5	FRP material selection and structural design	429
9.4	Shear Strengthening	429
9.4.1	General	429
9.4.2	Failure mechanisms	430
9.4.3	FRP contribution to shear capacity	432
9.4.4	Effective FRP strain	433
9.4.5	FRP material selection	436
9.4.6	Elements with circular cross section	437
9.5	Confinement	438
9.5.1	General	438
9.5.2	Behavior of concrete confined with FRP	439
9.5.3	Analytical modeling for circular columns	442
9.5.4	Rectangular columns	443
9.5.5	FRP material selection for confinement	444
9.6	Summary and Conclusions	445
